# LeadFree **BATTERY CABLE HARNESSSES**

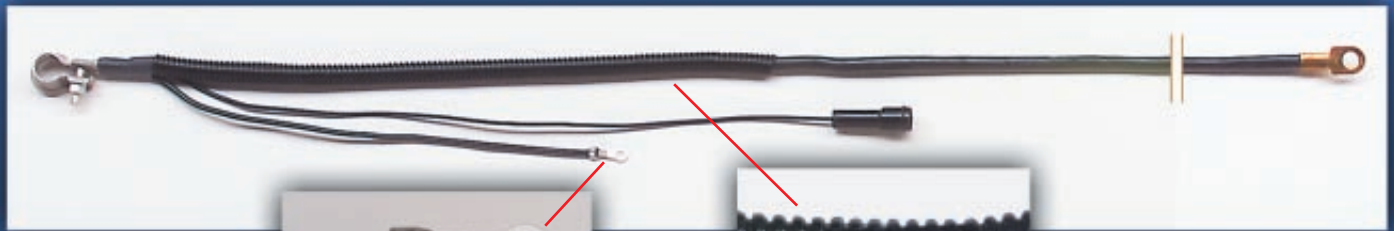

No longer simply a length of cable finished with a lead terminal, today's lead free battery cables are wiring harnesses containing multiple trailing leads that perform a variety of functions. To service this specialty component, BWD announces a line of new, O.E. match lead free battery cable harnesses. Each harness is application specific, duplicating O.E. fit and function with no splicing, crimping or stripping! All lead free harnesses contain 100% stranded copper wire for maximum conductivity. A rugged jacket of high-temp PVC resists heat, cold and autofluids.

Engineered from premium materials, BWD's lead free battery cable harnesses provide vehicle owners with worry-free driving and installers with time-saving component installations!

Battery terminals are constructed of tin-plated brass for maximum corrosion protection and are sized for correct polarity.

Trailing lead lengths and connectors exactly match O.E. for a perfect fit.

Precise, heavy-duty crimping on even the smallest terminals insures solid grounding and firm connections.

Extra protective loom is included where specified by O.E. to eliminate cable rub-through and abrasion caused by road vibration.

Mid-mount terminals add extra stability where required to combat cable twisting and torsional stress.

Angled terminals match O.E. configurations for ease of installation and perfect fit.
